Title : Protective Glass for Welders.

Orig Pub: Szkoi ceram., 1956, 7, No 9, 244-249

Abstract: The technique of manufacturing protective glass (PG) for welders was developed at the central laboratory of the glass industry (Zavertse, People's Republic of Poland) and a pilot plant for this manufacturing was arranged at the Yaslo works. PG must protect the eyes from ultraviolet rays ($\lambda = 240$ to $314 \text{ m}\mu$), from rays of visible light ($\lambda = 430$ to $760 \text{ m}\mu$) and infrared rays ($\lambda = 800$ to $1600 \text{ m}\mu$), and, in particular, it must decrease the infrared radiation to the limit < 1.9 cal per sq. cm per min. The foundations of the classification of PG accord-

of PG manufacturing are briefly enumerated. The light absorption depends on the introduction of coloring oxides of Fe, Co, Ni, Cu, Ti, Ce, Pr and Nd into the charge. 3 to 5% of Fe_2O_3 + 5 to 7% of FeO is most frequently introduced into PG. Metallic powder of Zn, Al or Sn or bitartrate of K are used for reducing Fe_2O_3 to FeO.

TITLE: Infrared Radiation Absorbing Glass

PERIODICAL: Szkło i Ceramika, 1960, No. 12, pp. 361 - 364

TEXT: As a result of the increasing demand (about 100,000 m² annually) for automobile windshields made of glass which absorbs infrared radiation, the Centralne Laboratorium Przemysłu Szklarskiego (Central Laboratory of the Glass Industry) began laboratory and industrial tests connected with production technology of 6-mm thick glass absorbing about 70% of infrared radiation in the range of from 0.7 to 3.0 μ. The research was divided into a) laboratory tests, b) melting on small industrial scale in the Huta Szkła "Jasło" (Glass Plant "Jasło") and c) melting on industrial scale in the ZSL "Wałbrzych". Laboratory investigations were made on glass melted in a laboratory furnace, and its absorption properties were tested with a Zeiss spectrophotometer in the range of from 0.7 to 3.0 μ. A normal d-c "Nitra" lamp was used as infrared radiation source and the monochromator was equipped with saline prism making possible the measurement of infrared radiation up to 17 μ. The test results revealed that the glass produced by the ZSL "Wałbrzych" plant has X

Card 1/2

Infrared Radiation Absorbing Glass

the best absorption properties. The third and best casting contained: sand - 300 kg; limestone - 99 kg; soda - 84 kg; sulphate - 9 kg; chalybite - 10 kg; and 360 kg of cullet from the second casting. Chemical compounds : SiO_2 - 68.05%; Al_2O_3 - 0.68%; Fe_2O_3 - 0.92%; CaO - 13.10%; MgO - 1.94% and Na_2O - 15.23%. The casting was made in a 12-pot furnace at 1,440°C. A comparative analysis of glass produced by the "Jasło" plant, the ZSL "Wałbrzych" and the Czech glass type "Detremal" showed that the 3rd casting made by the ZSL "Wałbrzych" has far better infrared absorption qualities than the latter. There are 4 tables, 1 figure and 4 references: 1 Czech and 3 English.

ACCESSION NR: AP5012195

AUTHOR: Nowak, M. (Novak, M.)

TITLE: Direct solution of the Possio equation for incompressible flow

SOURCE: Polska Akademia Nauk. Bulletin. Serie des sciences techniques, v. 13,
no. 2, 1965, 127-131

TOPIC TAGS: incompressible flow, mathematic analysis, harmonic oscillation

ABSTRACT: Possio's equation is a complete mathematical formulation for the fully linearized problem of determining the pressure distribution on a harmonically oscillating profile in a uniform fluid flow. Numerical methods used in considering the flow of a compressible fluid are based on this equation. However, no solution of this equation for such a case has so far been obtained in closed form. The form of the solution is known for the case of an incompressible fluid. Various methods are used for obtaining this solution, however none of them starts from the Possio equation. They are based instead on the equivalent boundary problem for the velocity potential. A method is proposed in this paper for deriving a closed solution directly from the Possio equation for an incompressible fluid. The equa-

Card 1/3

L 64709-65

ACCESSION NR: AP5012195

tion has the form

$$w(x) = k \int_{-1}^1 \gamma(t) K(s) dt \quad (1)$$

with the kernel

$$K(s) = \frac{1}{2\pi i s} - \frac{i e^{-is}}{2\pi} \left\{ C_l(1,0) + i \left[S_l(s) + \frac{\pi}{2} \right] \right\},$$

where $s = k(x - t)$; $k = \frac{\omega b}{U}$ is the frequency coefficient, ω is the circular oscillation frequency, b is the semi-chord of the profile and U is the velocity of undisturbed fluid flow. Normal flow velocity at the profile is $w(x)e^{i\omega t}$. The difference between fluid pressures on both sides of the profile is $\Delta p(x,t) = -\rho U \gamma(x) e^{i\omega t}$, where ρ is the density of the fluid. In view of physical conditions (the Kutta-Zhukovskiy condition must be satisfied), the solution for the equation is sought within a class of functions assuming the value $\gamma(1) = 0$ (class $h(1)$ in Muskhelishvili's notation). The solution is obtained by using analytic continuation and formulating

AUTHOR: Nowak, R.

TITLE: Experimental investigation of diffuse oscillations

SOURCE: Archiwum elektrotechniki, v. 14, no. 2, 1965, 313-331

TOPIC TAGS: diffuse oscillation, white noise, oscillation system, signal-to-noise ratio

ABSTRACT: The paper contains an analysis of an experiment which was made in order to verify the relations resulting from a theoretical model of diffuse oscillations as previously developed by the author (Rozpr. Elektrot, vol. 10, No. 3, 1963). The model determines the parameters of oscillations generated in the presence of white noise. Measurements were made in an oscillation system, shown in Fig. 1 of the Enclosure, which artificially increases the level of thermal noise, resulting in the establishment of conditions conforming with the theoretical assumptions of the model as well as in the considerable simplification of problems arising from the sensitivity of the method. The measurement system is shown in Fig. 2 of the Enclosure. In the course of the measurements, particular attention was paid to the determination of the parameters related to the fluctuations of the oscillation phase. The measurement assumptions and errors are discussed. The follow-

Card 1/4

L 61893-65

ACCESSION NR: AP5018387

ing measurements were made: (1) the effect of the signal-to-noise ratio on the reactive power equilibrium, achieved indirectly by measuring the mean frequency change as a function of the signal-to-noise ratio; (2) the standard deviation of frequency as a function of the time interval of measurement; (3) the standard deviation of frequency as a function of the oscillation amplitude; (4) the spectral composition of the diffused oscillations; (5) the amplitude fluctuations, the envelope voltage, and the spectrum of the envelope voltage. The results show that in case of oscillators the diffusion model describes correctly the effect of white noise on the oscillatory system. For time intervals comparable with and shorter than the time constant of the oscillating circuit, frequency deviations from monochromatism are larger than those resulting from relations derived from the diffusion model. Disturbance of the reactive power equilibrium by introducing noise into the oscillating circuit decreases the fundamental frequency, this effect being reduced by increasing the signal-to-noise ratio. "The author thanks Prof. J. Groszkowski and S. Ryzko for discussing the problems which arose during the investigation." Orig. art. has: 10 figures and 13 formulas.

3038. NOWAK S. Klin. Chor. Dziecięcych A. M., Poznań. *Zakażenie pąteczką
ropy błękitnej jako powikłanie w leczeniu antybiotykami. Infection with
Bac. pyocyaneus due to antibiotic therapy PEDIAT. POL.
1956, 31/10 (1121-1124)

Infection with *Bac. pyocyaneus* is not rare in infancy and is almost solely observed in dystrophic infants. The 3 described cases in infants had well developed. Due to a treatment with large doses of various antibiotics (especially broad-spectrum antibiotics), an infection with *Bac. pyocyaneus* ended fatally.
